

UNIT-1

UI VS UX DESIGN

NAME: MOHAMED KASIM.M

ROLL NO: 24CDR067

User Experience (UX) Design and User Interface (UI) Design are two closely related but distinct aspects of product development. UX focuses on the overall experience users have when interacting with a product, ensuring it is easy, efficient, and satisfying. UI, on the other hand, deals with the visual and interactive components such as colors, fonts, buttons, and layouts that shape how users engage with the system.

For example, in a flight booking website, the UI provides the elements that allow users to search for and select flights. However, the UX encompasses the entire journey — from searching to successfully completing the booking — focusing on how seamless, intuitive, and enjoyable the process feels. Thus, while UI shapes the look and feel, UX ensures the experience meets users' needs and expectations.

Involving UX from the early stages of product development is essential to identify and fix usability issues before they become costly. UI supports and extends UX by creating a clear and appealing interface that enables users to perform tasks smoothly. Together, UX and UI work to create a user-centered product that is both functional and visually engaging, delivering a positive and efficient digital experience.
